cc in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer, and for detecting genes that are compounded of the invention can be used in diagnostic purposes and also as cargets for screening for therapeutic compounds that modulate breast concer (e.g. hormones or antibodies). Identification of genes that are cover or under expressed in breast cancer can additionally provide high-constroin, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 # identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated for identifying a compound that modulates a lung cancer-associated for identifying a compound that modulates a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous leadions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity preumonitis, interstitial pulmonary fibrosis astema and for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences

ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the

Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                   The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polynuclectide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 nucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, and as vaccines. This sequence corresponds to one of the nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          used for the detection method of the invention.
                                                                                                                                           Claim 10; Page 297; 332pp; English.

Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting useful for diagnosing, prognosing or to a nucleic acid in a biological sample.

Claim 8; SEQ ID NO 41; 1385pp; English

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention also relates to expression vectors and host cells comprising a nucleic acid of the invention. The invention is antibodies which specifically bind a polypeptide of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; colypeptides and mucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present invention relates to nucleic acids and proteins (ADN38683-ADN40064) sequence represents a nucleic acid sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-NOV-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14-NOV-2001;
                                             19-SEP-2002
The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the rest agent as a candidate p53 pathway modulating agent. The method is useful for identifing a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; anti-HIV; cytostatic; antidiabetic; antiasthmatic; cachexia; AIDS; antiinflammatory; cardiant; haemostatic; neuroprotective; anorectic; nootropic; immunosupressive; osteopathic; antiparkinsonian; cancer; antiinfertility; carebroprotective; gene therapy; NOVX; NOV; Ertility; metabolic disorder; diabetes; obesity; infectious disease; anorexia; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; immune disorder; heematopoietic disorder; cardiovascular disorder; bronchial asthma; dyslipidemia; metabolic disturbance; neurogenesis; metabolic syndrome X; wasting disorder; cell differentiation; gene; cell proliferation; haematopoiesis; wound healing; angiogenesis; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, cardiovascular disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disturbances associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99555 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes,
                                                                                                                                                                                                                                                                                    cancer,

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the professed leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell confideration, infections, and inflammantory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extractes of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The solution process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for the present sequence encodes feline 574 protein Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat. ```
The invention relates to a novel Major Histocompatibility Complex (MHC) class I peptide epitope of the 5T4 antigen. The invention further provides a polypelicope string comprising the 5T4 epitope; a uncleic acid sequence encoding the 5T4 epitope atring of the 5T4 epitope atring of the 5T4 epitope atring of the 5T4 epitope of the 5T4 epitope, a vector system capable of delivering the 5T4 epitope nucleic acid to a cell, a cell pulsed with the 5T4 epitope, a polypelitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease of a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid; a method comprising the presence of the 5T4 epitope or its encoding nucleic acid in a subject; and a T cell line or clone capable of specifically recognising the 5T4 epitope in conjunction with an MHC class I molecule. The 5T4 epitope has cytostatic acid; and the vector system or cell is useful in the prevention and/or treatment of a disease, partendarly cancer. The detection method is useful for diagnosing or monitoring the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or preventing a disease. This polymucletide sequence represents the feline of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                              New major histocompatibility complex class I peptide epitopes from human 5T4 tumor-associated antigen, useful for preventing and/or treating a

```
The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA coding for the feline 5T4 protein.

(TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen itself can be used to elicit an immune
                                                                                                                                                                                                                                                                                                                                     Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                         present sequence encodes the human 5T4 tumour-associated antigen

The specification describes the use of a single chain antibody (ScFv), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The ScFv antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for invivo imaging and/or for adjuvant treatment of a disease. The ScFv antibody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune disease, cancers, central nervous system disorders including Parkinson's disease, paridonneal diseases, cardioulmonary diseases, aradiovascular disease, gastrointestinal disorders inflections, diabetes, Helicobacterrelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce ScFv of the invention

```
The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in sequinicant proportion of tumours. The Squences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine protein are useful for isolating foetal cells from maternal blood. The
                                                                                                                                                                                                                                                                                                                                                                          Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        isolation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus (es) The present sequence encodes canine 514 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 1263 BP; 200 A; 469 C; 377 G; 217 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

transcription units that populate a genome. The library comprises several cligonuclectides, each capable of hybridising selectively to a set of messenger RNAs transcription unit of the genome, which encodes one or more messenger RNAs splice variants. The coligonuclectide libraries are useful for detecting mRNAs from a cligonuclectide libraries are useful for detecting mRNAs from a cligonuclectide libraries are useful for detecting mRNAs from a cligonuclecting to expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal libraries may also be used as specialised mini libraries to detect transcripts of a sub-transcriptome under a particular biological state, and so allowing the detection of tissue and pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcriptom of a transcriptome of a particular disorder. ABN27253 to ABNS9589 represent oligonucleotide sequences from

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism the genome of organism, comprising contacting mRNA from cell of organism contacting manality in a single oligomucleotide primer (I) at low stringency, preparing single-stranded cDNA by reverse transcribing mRNA with (I), amplifying cDNA, sequencing the product, and repeating the contacting, preparing and amplifying steps with different primers and sequencing resulting cDNA, sequence from a genome of an organism corresponds to a nucleotide sequence of an open reading frame; for preparing a contig, conclection acid molecule from a genome of an organism corresponds to a nucleotide sequence of an open reading frame; for preparing a contig, contact or agenome of an organism. Aman for sequencing all or part of a genome of an organism. Sequencing a contig, contact or or breast cancer cell. The method is useful for analyses of colon cancer or breast cancer cell. The method is useful for analyses of large or small populations. further, it can be used to study living.

CC populations of subjects and can be used to carry out genetic analyses of copulations or population more or less likely to be afflicted with diseases such as cancer, to determine antibiotic resistance or nontolesting out in all animals, plants, birds, fish, etc. Using this method, the study of whether the conditions are likely to be passed to offegring the study of whether the conditions are likely to be passed to offegring the study of whether the conditions are likely to be passed to offegring the area of agriculture, for example the genomes of food crops can be studied to determine if resistance genes are present, defects in plant condition of the pathogens which may require different approaches to the pathogens which may require different approaches to the subtode analysis which may require different approaches to the subtode analysis which may require all the pathogens which analyses of the pathogens which m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     therapy. This method is also applied to eukaryotic pathogens, such as trypanosomes, different types of Plasmodium, etc. The method essentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     eliminates sequencing of non-coding portions. This sequence represents a polynucleotide isolated from human colon cancer cell cDNA library

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 1; SEQ ID NO 22978; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) is useful in gene therapy techniques to restore normal activity of (II) to to treat disease states involving oxpressed supplement. (II) and its binding patreners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in polypeptide and polymucleotide sequences have applications in the produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and cannot sequences a have the printed specification, but was obtained in the printed specification and specificat ftp.wipo.int/pub/published\_pct\_sequences

The invention describes a method comprising comparing an expression profile of at least one gene in a peripheral blood sample of a patient to the patient has a solid tumour, and each of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially expressed in peripheral blood mononuclear cells (PBMCs) of a first class of patients, where cot patients as compared to PBMCs of a second class of patients, where both the first and second classes is a subcluster formed by an each of the first and second classes is a subcluster formed by an early of the first class of patients has a first clinical outcome, adoutcome, also patients who have the solid tumour, and where the majority of the second class of patients has a second clinical outcome, also described are: a system comprising (i) a memory or a cutcome. Also described are: a system comprising (i) a memory or a storage medium including data that represent an expression profile of at cast one gene in a peripheral blood sample of a patient who has a solid tumour, (i) at least enother storage medium including data that represent at least one reference expression profile of the gene, (iii) a processor capable of executing the expression profile of the gene, (iii) a processor capable of executing the comparing the expression profile of the patients who have the solid tumour correlate with commonuclear cells of patients who have the solid tumour correlate with the program, where each of the patients and second classes of patients as econd classes of patients as econd classes of patients as econd classes of patients has a first clinical outcome, and where the first class of patients has a second classe of patients are nearly as energy of concern and array are area as econd classes of patients has a first clinical manner and where the first class of patients has a first clinical manner and each an

A method, useful for prognosing and treating solid tumor, comprises comparing an expression profile of a gene expressed in peripheral blood mononuclear cells to a reference expression profile of a gene.

Disclosure; Page; 111pp; English.

The method, system, and array are useful for prognosing and treating solid tumours. This sequence represents a solid tumour prognosis gene of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastesis in colorectal and gastric cancer. 574 antigen may therefore be useful in tumour diagnosis, targeting and immunorherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the human or murine 574 gene sequence. The 574 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

```

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis of breast cancer cells detecting genes that are up or down-regulated in breast cancer cells defecting genes that are method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-sensitivity datasets which can be used in the areas of - ABT07761 the invention diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT07693 - ABT07761 represent the 69 breast cancer-associated gene sequences of the inventi Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.

Claim 22; Page 336; 453pp; English

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in a sequence that is at least 80 % identical to a gene that exhibits in creased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell ung cancer or other benign or precancerous lesions, e.g. atleetasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, bronchiectasis. The genes, polynucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences and as targets for screening for therapeutic compounds that modulate lung cancer-associated polynucleotides of the nvention

                                                                                                                                                                                      ADN38723;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnosing ovarian cancer and in identifying and using agents and/or
targets that inhibit ovarian cancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
monitoring response to therapy, selecting patients for post-operative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chemotherapy or radiation therapy, in selecting mode of therapy, determining tumour prognosis, early detection of pre-cancerous lesions, and as vaccines. This sequence corresponds to one of the nucleic acids

Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a

polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides and nucleic acids. The nucleic acids, polypeptides antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Li D;
acid of the invention; antibodies which specifically bind a

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

Claim 16; Page 114-115; 619pp; English

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a edicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or disgnosing diseases unch as metabolic disorders, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, immune disorders, heematopoietic disorders, cardiovascular disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disorders associated with obesity, metabolic syndrome X or wasting disorders associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g.

```
neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods
                                                                                                                                                                                                                                                                                                                         Feline; cat; oncofoetal leucine-rich glycoprotein; 5T4; tumour; call proliferative disorder; infection; inflammatory condition; cancer immunotherapy; foetal cell; maternal blood; cytostatic; foetal abnormality; foetal sex determination; gene; ss.

Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat. P-PSDB; AAU98694.

(OXFO-) OXFORD BIOMEDICA UK LTD.

13-NOV-2001; 2001WO-GB005004. 13-NOV-2000; 2000WO-GB004317. Carroll M;

WPI; 2002-557449/59. Myers K, Drury N,

Claim 4; Page 68; 68pp; English.

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also

```
be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 5T4 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 5T4 protein are useful for isolating foetal cells from maternal blood. The isolation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus The present sequence encodes feline 5T4 protein

class I peptide epitopes from human for preventing and/or treating a New major histocompatibility complex ST4 tumor-associated antigen, useful disease, particularly cancer.

Disclosure; Page 67; 73pp; English.

The invention relates to a novel Major Histocompatibility Complex (MHC) class I peptide epitope of the 5T4 antigen. The invention further provides a polyepitope string comprising the 5T4 epitope, a nucleic acid sequence encoding the 5T4 epitope or a polyepitope string of the 5T4 epitope, a vector system capable of delivering the 5T4 epitope nucleic acid to a cell; a cell pulsed with the 5T4 epitope, a polyepitope of the

comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 514 epitope and/its encoding nucleic acid; a method comprising detecting the presence of the 514 epitope and of the or clone capable of mucleic acid in a subject; and a T cell line or clone capable of specifically recognising the 574 epitope in conjunction with an MHC class of mucleic acid in a subject; and a T cell line or clone capable of specifically recognising the 574 epitope in conjunction with an MHC class of mucleic acid in the 574 epitope has cytostatic activity. The vaccine comprising the 574 epitope has cytostatic activity. The vaccine comprising the 574 epitope or its encoding nucleic acid and the vaccine system or cell is useful in the prevention and/or treatment of a disease, particularly cancer. The detection method is useful for detecting the progression of a cancerous disease, and for detecting the presence of the 574 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or consecuted preventing a disease. This polymucleotide sequence represents the feline or clone treating and coding DNA of the invention.

The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide connucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA coding for the feline 5T4 protein.

Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

Example 2; Page 78; 79pp; English

(TAAÎ. The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult issues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the The present sequence encodes the human 5T4 tumour-associated antigen

```
present sequence. The 5T4 antigen was shown to be effective at eliciting an immunocherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description

The TAA : The TAA ST4 is a glycoptocen which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastrasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been inculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject. The present sequence appears in GenBank at accession number AJ012160
                                                                                                                   Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                   The present sequence encodes the mouse 5T4 tumour-associated antigen
                                                                                                                                                                                                3xample 2; Page 78; 79pp; English.

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression a activity of the expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for screening composition. Compositions, antibodies and antisense molecules are useful cort the treating a disease associated with STAT6 activation such as allergic diseases, inflammation, autoimmune diseases, diabetes, objective diseases associated with STAT6 activation and/or prevention of thyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STAT6 activation and/or prevention of thyperlipidaemia, infections diseases and cancers. Compositions are useful for treating diseases. Compositions are also useful in rheumatoid arthritis, osteoarthitis, softenic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 cativation or inhibition of STAT6. The present sequence represents a human cDNA encoding a protein which promotes STAT6 activation.
                                                                                                          l transducer and activator of transcription 6 activation

```
The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or itse spitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation such as composition. Compositions, antibodies and antisense molecules are useful for expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for treating diseases, inflammation, autoimmune diseases diabetes, allergic diseases, inflammation, autoimmune diseases diabetes, byperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STAT6 activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid arbitis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6. The prosein sequence represents a ccivaty. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive human rows are not inhibition of STAT6. The present sequence represents a professive when a professive and prover and the present sequence represents a professive when a professive and prover and the present sequence represents a professive and prover and a professive and prover and a professive and prover a prover and a professive and prover a professive and prover a professive and prover a professive and prover and a professive and prover and a professive and a professive and a professive and a prof

encoding the and/or Novel canine or feline 5T4 polypeptide and polynucleotides polypeptide, useful in preparation of vaccine for treating preventing cancer in a subject, preferably a dog or cat.

Claim 4; Page 68; 68pp; English

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 5T4, and the concofoetal leucine-rich glycoproteins known as 5T4, and the concofoetal leucine-rich glycoproteins known as 5T4, and the polymucleotide sequences encoding them. The 5T4 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutrical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, considerably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals resequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific concentrated and localisation of 5T4 in extracts of plasma, urine, consument and localisation of 5T4 in extracts of plasma, urine, consument and localisation for isolating focus calls from maternal blood. The contein are useful for isolating focus calls from maternal blood. The content are useful for isolating focus calls from maternal blood. isolation process may form part of a diagnostic method e.g. the foetal cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es) The present sequence encodes feline 5T4 protein

The invention relates to a novel Major Histocompatibility Complex (WHC) class I peptide epitope of the 5T4 antigen. The invention further class I peptide epitope string the 5T4 epitope; a uncleic acid sequence encoding the 5T4 epitope or a polyepitope; a uncleic acid ceptope; a vector system capable of delivering the 5T4 epitope nucleic epitope; a vector system capable of delivering the 5T4 epitope nucleic comprising the above; a method for treating and/or preventing a disease comprising the above; a method for treating and/or preventing a disease comprising the above; a method for treating and/or preventing a disease comprising the above; a method for treating and/or preventing a disease comprising the above; a method for treating and/or preventing a disease comprising the presence of the 5T4 epitope and/its encoding nucleic acid; a method comprising the 5T4 epitope and/its encoding nucleic acid; a method comprising the 5T4 epitope has cytostatic acid; it has specifically recognising the 5T4 epitope in conjunction with an MHC class comprising the 5T4 epitope has cytostatic acid; it has vaccine system or cell is useful in the prevention and/or treatment of a disease, comprising the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone created and the manifacture of a medicament for treating and/or cone con the antifacture of a medicament for treating and/or cone con the cone con the contract of the first encoding acid in the felline con contracting and sease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New major histocompatibility complex class I peptide epitopes from human 5T4 tumor-associated antigen, useful for preventing and/or treating a disease, particularly cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preventing a disease. This polynucleotide sequence represents the feline 574 antigen coding DNA of the invention.
                                                                                  Major Histocompatibility Complex class I peptide epitope; MHC; 5T4 antigen; 5T4 epitope; polyepitope string; vaccine; T cell; cytostatic; cancer; feline; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

The invention relates to a Major Histocompatibility Complex (MHC) class clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the prosession of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA

This invention is related to a novel isolated canine nucleic acid
sequences and the construction of canine microarrays containing a
significant portion of the canine genome. The isolated canine nucleic
acid sequences of the invention may be useful for assessing the
coxicity assays. The invention is therefore useful for assessing the
impact, including toxicity, of a compound, pharmaceutical agent or
environmental pollutant on a call or living organism. The methods are
useful for detecting genes that are up- or down-regulated in canines in
disease state. The sequences are useful as diagnostic agents or markers
to detect a callular response in a sample individually or as part of a
gene expression profile. It is also useful as a target for agents that
condulate gene expression or activity. The database is useful for
modulate gene expression or activity. The database is useful for
producing electronic Northerns that allow the user to determine the cell
type or tissue in which a given gene is expressed and to allow

containation of the abundance or expression level of a given gene in a
particular tissue or cell. The methods are useful for determining the
confermination of that a compound or test agent will induce various specific
likelihood that a compound or test agent will induce various specific
confisease, protein adduct formation or hebattis), those of the kidney,
chart, brain or testes, or other pathologies associated with at least one
cof the toxins. The methods are also useful for predicting or elucidating
the potential cellular pathways influenced, induced or modulated by the
compared to the profile induced by a known toxin. The present sequence is
compared to the profile induced by a known toxin. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a o

The invention relates to an isolated polynucleotide (ABN27253-ABN33262) with cytostatic activity. The polynucleotide is used to produce a polypeptide, to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and to inhibit tumour growth. The polynucleotide is used as a probe in mapping and tissue profiling. The encoded polypeptide and antibodies to the polypucleotide can also be used for therapeutic and diagnostic purposes. The polynucleotide is useful for gene therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid for producing a polypeptide, detecting differentially expressed genes correlated with a cancerous state of a mammalian cell,

The invention relates to 9672 polynucleotides (ACL53866-ACL63537) which are differentially expressed in colon cancer cells. The invention also cardetess to vectors and host cells comprising a differentially expressed polynucleotide of the invention; a method for detecting a cancercus cell by detection of a gene product of the polynucleotides; a method for inhibiting a gene product of the polynucleotides; a method of treating an individual with cancer by administration of a medulator of a gene product of the polynucleotides; and an isolated antibody that specifically binds to a polyneptide encoded by one of the 9672 polynucleotides. The polynucleotides, polypeptide on a tibodies, and methods are useful for the detection of cancerous cells; for the diagnosis, prognosis and management of cancer, for the identification of agents that modulate the phenotype of cancerous cells; for the identification of cancer, especially colon cancer and metastacized colon cancer, but also breast or pancratic cancer. The polynucleotides are also useful as a source of probes or primers for use in diagnostic methods. The differentially expressed polynucleotides or their encoded protein can be accounted by the present and properties or expressed in colon cancer. The polynucleotides or represents a specifically claimed polynucleotide which is differentially expressed to modulate primary immune responses for the prevention or treatment of cancer. The present sequence represents a specifically claimed polynucleotide which is differentially context on the sequence data for this patent did on the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotides, which are differentially expressed in colon cancer cell, useful for treating cancer, e.g. colon cancer, breast
                                                                                                                                                                                                         Differential expression, diagnosis, therapy, drug screening, cancer, neoplasm, colon tumor, breast tumor, pancreas tumor, cytostatic, vaccine,

The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a blological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosts or preast cancer calls. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT0763 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting a breast cancer-associated transcript in a patient's cell, useful for diagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast cancer nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits in cassociated polymucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell for treating lung cancer or other benign or precancerous leashons, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, intersitial pulmonary disease, fibrosis, bronchiectasis. The genes, polymucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences compounds that modulate lung cancer, such as antibodies. Sequences
                                                                                                                                                                                                                                                                                                        Lung cancer-associated polynucleotide; gene; ds; cytostatic; emphysema; antiinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer, benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 927 BP; 187 A; 297 C; 240 G; 203 T; 0 U; 0 Other;

```
The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polymucleotide that selectively
biological sample from the patient with a polymucleotide that selectively
chybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
chicken and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
concers, monitoring and early detecting patients for post-operative
committeering tumour prognosis, early detection of pre-cancerous lesions,
and as vaccines. This sequence corresponds to one of the nucleic acids
used for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                   cytostatic; gene therapy, vaccine; ovarian cancer; diagnosis; post-operative chemotherapy; radiation therapy; tumour prognosis; pre-cancerous lesion detection; ds; gene.

```
The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; or polypeptides and methods are useful for diagnosing, prognosing and treating antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; p53 pathway; Leucine rich repeat capricious related protein;

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; anti-HIV; cytostatic; antidiabetic; antiasthmatic; cachexia; AIDS; antinflammatory; cardiant; haemostatic; neuroprotective; anorectic; nootropic; immunosuppressive; osteopathic; antiparkinsonian; cancer; antinfertility; carebroprotective; gene therapy; NOVX; NOV; Fertility; metabolic disorder; diabetes; obesity; infectious disease; anorexia; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; cardiovascular disorder; bronchial asthma; dyslipidemia; metabolic disturbance; neurogenesis; metabolic syndrome X; wasting disorder; cell differentiation; gene; cell proliferation; haematopoiesis; wound healing; anglogenesis; ds.

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

Claim 16; Page 114-115; 619pp; English.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99327-ABV99555 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

```
The NOVX coding sequences and proteins are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obsestly, infectious disease, anorexia, cancerassociated cachexia, cancer, neurodegenerative disease, Alzheimer's disease, Parkinson's disease, immune disorders, heematopoietic disorders, cardiovascular disorders, fertility, bronchial asthma, ALDS, dyslipidemia, metabolic disturbances associated with obestly, metabolic syndrome X or wasting disorders associated with obselvy, metabolic syndrome X or wasting disorders associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of therapeutic or diagnostic methods

Human DNA sequence from clone RP3-467D16 on chromosome 6p22.3-24.1

Contains the 5' end of the SCAl gene for spinocerebellar ataxia 1

(olivopontocerebellar ataxia 1, autosomal dominant, ataxin 1) with a poly-glutamine (CAG repeat) polymorphism and the 3' part of the GMPR gene for GMP reductase, Guanosine 5'-monophosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest. This finishing standard has alightly changed from the previous thuman standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The BAC Library has been constructed by Pieter de Jong and coworkers (http://www.chori.org) from male CSTBL/6J mouse spleen and/or brain genomic Dw. The clone and detailed information can be obtained from Pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO.
